Amendments to the Claims

This listing of claims will replace all prior listings of claims in the application.

Listing of Claims

- 1. (Original) A separating agent for enantiomeric isomers, comprising a polysaccharide derivative carried on a porous carrier, wherein: the porous carrier has an epoxy group; and the epoxy group and part of hydroxyl groups of the polysaccharide derivative are chemically bonded.
- 2. (Original) The separating agent for enantiomeric isomers according to claim 1, wherein the polysaccharide derivative comprises cellulose or amylose.
- 3. (Currently Amended) The separating agent for enantiomeric isomers according to claim 1 or 2, wherein the polysaccharide derivative comprises a polysaccharide carbamate derivative or a polysaccharide ester derivative.
- 4. (Currently Amended) The separating agent for enantiomeric isomers according to any one of claims 1 to 3claim 1, wherein the porous carrier comprises silica gel.
- 5. (Currently Amended) The separating agent for enantiomeric isomers according to any one of claims 1 to 4claim 1, which is used as a stationary phase for chromatography.
- 6. (Currently Amended) The separating agent for enantiomeric isomers according to any one of claims 1 to 4claim 1, which is used as a stationary phase for continuous chromatography.

- 7. (Currently Amended) A method of producing the separating agent for enantiomeric isomers according to any one of claims 1 to 6claim 1, comprising the step of chemically bonding a porous carrier having an epoxy group and a polysaccharide derivative having hydroxyl groups by reacting the porous carrier and the polysaccharide derivative in an organic solvent under heating.
- 8. (Currently Amended) A method of producing the separating agent for enantiomeric isomers according to any one of claims 1 to 6 claim 1, comprising the steps of:

chemically bonding an epoxy group of a porous carrier and hydroxyl groups of a polysaccharide derivative by reacting the porous carrier having the epoxy group and the polysaccharide derivative having the hydroxyl groups in an organic solvent under heating; and

reacting hydroxyl groups of a product formed in the previous step and a compound having a functional group which may react with the hydroxyl groups.

- 9. (Original) Use of a substance, as a separating agent for enantiomeric isomers, which has a polysaccharide derivative carried on a porous carrier, wherein: the porous carrier has an epoxy group; and the epoxy group and part of hydroxyl groups of the polysaccharide derivative are chemically bonded.
- 10. (Original) A method of separating enantiomeric isomers by using a substance which has a polysaccharide derivative carried on a porous carrier, wherein: the porous carrier has an epoxy group; and the epoxy group and part of hydroxyl groups of the polysaccharide derivative are chemically bonded.
